Sea Cross Marine exports navigation system for high-speed boats to NATO

Sea Cross Marine AB has received, through its customer Goldfish Boat AS, an order to deliver their high speed navigation system SeaCross of specially developed hardware and software to be used on the 36 RHIB developed by Goldfish Boats.

Goldfish Boat signed a contract earlier this year to deliver these 36 feet Rigid Hull Inflatable Boat RHIB to the Norwegian Navy.

Sea Cross Marine has developed a system for high-speed boats offering incomparable benefits for presenting information critical for high-speed boats. The SeaCross system combines sophisticated radar background underlay (RBU) and non-terrestrial object enhancement (NTE) to support military operations. The outstanding system reaction time (SRT) eliminates any delay in presentation of navigation information. The system is designed to present information without delay for speeds of up to 100 knots.

The SeaCross navigation system is very easy to use, something which is crucial for high-speed operations. The user interface is without "difficult to use" multifunction buttons and hidden menus. By using graphical icons, all functions can be accessed with only three buttons.

Capacities of the RHIB remains classified information, but in general we find that these customers highly value the unique sea keeping capabilities and performance we offer, says Henrik Sollie, Sales and Marketing manager at Goldfish Boat AS.

"By offering a solution comparable to WECDIS (Warship Electronic Chart Display and Information System), but with the possibility to customise it according to the particular requirements of the Norwegian Ministry of Defence, we will deliver a solution that meets their needs", says Per Österberg CEO at Sea Cross Marine AB.

Sea Cross Marine AB is the manufacturer of the SeaCross navigation system. The company has developed its own proprietary navigational software for the maritime market with several unique functions. By its "very easy to use" graphical interface, SeaCross has made breakthroughs in several market segments.
